GOOGLE PAY CARDING METHOD, PLAY STORE AND NFC

INCLUDED, 2024 QUICK AND EASY

Google Pay CARDING METHOD

Introduction

Linking a card to play store gives you benefits to use as payment method in all supported options like buying apps in play store, some websites support Google pay option and once in checkout, you can choose Gpay and pay via the linked Card

If your phone supports NFC technology, you can pay via the linked card in **Google Play store to pay with it**

All that matters is you have a phone

supporting NFC and a good card.

For this method, you just need to have a phone for NFC, I will guide how to add the card to Playstore

Google Pay carding method Requirements:

- Android Phone – This is the Google Play method, we need android phone
  - NonVbv CC with Fullz – Card without 2fa for linking with play store
  - Vpn– Make sure billing address is matching the location on vpn
  - NFC – If you plan to use NFC in store, make sure your phone can support it

For easy carding, always use a card with all fullz info as it saves you time to get background info. For this guide, we just need cc info, address and full names as long as the card is nonvbv

Important

We will add our cc to google play store payment options. The card will be used for in-app purchases or any site with google pay option. Small purchases work fine even if card is secured but large ones will trigger 3d verifications. So, make sure you have a nonvbv card.

You will need to have a clean android phone, don't use your main one as I'm sure it has an already linked email account. It is easy to find an android phone, don't use rooted.

Vpn Setup

For carding with phone, we will need a vpn, since its hard to set proxies on phone. A good option most carders go with is the Express Vpn. You can download from play store and register. IF you need license, ask for admin easily from our cracked accounts. Just make sure you can change the **location** and **time** to match the billing or your fullz

Add Card to Playstore

Now to make sure we use Gpay, we need to add the card to Playstore. But first

- Remove any account linked to the android phone
- Clear data and force stop the Playstore app
- Make sure your vpn is running and location is same as owner of card
- Open Playstore and accept the prompt
- Go to settings and payment methods

Now you need to add you fullz info in the credit or debit option. We will use this card to pay with Google Playstore

Make sure to add the card and no other card was linked before

You should only card with a fresh account so not to leave traces

Verification

To use a card, Google will try to contact the bank for authorization, Normally the card will ask for 2fa which is mostly SMS enabled. A code will be sent to SMS and you will be asked to enter

Not all cards do this and some are not that secure and not set the 2factor auth. This are the NonVbv Type and hence to succeed in the method

You might have used a such card and know what am talking about. The image on the right is of a card with security. You can't activate the card since you won't know what code to put since it will be sent to owner of the card

A non-vbv on the other hand will try to ask for 2fa but since none is set, I will add successfully and link your card

Now we have a linked card, we now can make purchases. We can use the card online on websites that support Gpay or Playstore or NFC stores

Trying to buy on a site that support Gpay WE will have the following option.

Cashout

You can use sites like egifter.com to buy gift cards with Gpay and sell for bitcoin in paxful

For Google Pay via NFC, you can visit the store and pay with the phone, for this you have to activate NFC in wireless networks if it is disabled.

When paying in store, you just have to move your phone close to the store terminal.

It is very easy, since the owner of the store won't know what card you used and no need for proof of anything

This was the Google Pay carding method.
