IMPORTANCE OF TRADING STYLE

Thank You for buying this fantastic educational stuff! I have had many requests for the best Crypto trading strategies for quite a while ago. So I decided to get on board and give you easy trading techniques (eBook) that I think is one of the best trading strategies eBook you can find.

In following pages, I will try to share at least 3 successful market-tested trading strategies suitable for each type of trader.

Before picking or choosing a specific trading strategy, you need to understand what trading style do you follow?
Some popular trading styles are as follow:

Scalping. These are very short-lived trades, possibly held for just a few minutes. A scalper seeks to quickly beat the bid/offer spread and skim just a few points/pips/satoshi of profit before closing. Typically uses shorter time frame charts.

Day trading. These are trades that are exited before the end of the day, as the name suggests. This removes the chance of being adversely affected by large moves overnight. Trades may last only a few hours and price candles on charts might typically be set to sixty minutes.

Swing trading. Positions held for several days, looking to profit from short-term price patterns. A swing trader might typically look at with price candles showing every 4 hour to one day.

Positional trading. Long-term trend following, seeking to maximize profit from major shifts in prices. A long-term trader would typically look at the end of day or weekly charts.

SCALPERS/DAY TRADERS

STRATEGY 1

The HIGH5 Strategy:

The **HIGH5 strategy** suggests every 100 % move on either side of coin/asset follows minimum 5-10 % dip that can be used by scalpers and day traders to take chance, provided that the 100% move must be held within a single candle.

Let’s check, how this works actually.

In the ADX/BTC chart, you can see a single bullish candle of 100% follows the dip, can be used in scalping and day trading to earn 5 % easily. Although the dip in this specific case is much deep, but a scalper and day trader can enter short at 100% level with target 5 % on downside as exit level.

Let’s confirm this pattern in another chart,

More trading books in: https://t.me/tradingpdfgratis

Did you see?

It did happen again in the same pair. The higher move follows the dip at least 5%.

This scalping strategy is not specific to short selling but can also be used in LONG or Buying trade. Let see how; **SPR/BTC:**

Wow!
It works in buying case the same way it did work in short selling.

More trading books in: https://t.me/tradingpdfgratis

I hope you have quite beautiful understanding of this concept now. What scalping is, who is its beneficiary and how it can be used efficiently & effectively in crypto trading.

This **HIGH5** is my own strategy and it is specially designed for crypto scalpers and day traders. You won't be able to apply this in other financial markets i.e. Stock, Bonds, Forex and commodity markets.

STRATEGY 2

The BREAKOUT strategy:

I'm a huge advocate and fan of trading with momentum and the path of least resistance. I try to get on board an existing trend, wait for price to break the resistance and enter for scalping on breakouts.

The scalping on breakouts can easily reward us 5-10 %. Let me show you this with following example; OK/BTC

Can you see the chart above?
It is crystal clear in this 60 minutes candle chart that when price breaks the resistance it moves so fast in that direction, 5 – 10 % at least.

Let's take another example for better understanding of this concept;

OMG/BTC

More trading books in: https://t.me/tradingpdfgratis

Look at this OMG/BTC chart, when price breaks the horizontal resistance line a scalper and day trader can easily earn 5 % profit from the breakout.

Trading breakouts can be very dangerous if you are not scalping/day trading and using breakouts for long term gains. Because, sometime breakouts lead to sharp reversals and pair comes back in its previous range like you can see in above OMG/BTC chart. In that case, a trader may be trapped.

Trading on the break-down to new lows or on the break-up to new recent highs is often a major trap, especially for novice traders.

So, try not to be greedy.
Always take your profit and run from the market if you are truly A SCALPER or DAY TRADER.

STRATEGY 3

The INTERSECTION strategy:

The basic idea behind scalping and day trading is opening a large number of trades that usually last 60 minutes to 90 minutes.

However, some scalping and day trading strategies developed by professional traders have grown in popularity. For example, Paul Rotter placed buy and sell orders simultaneously and then used specific events in the order book to make short-term trading decisions.

Rotter traded up to one million contracts a day and was able to develop a legendary reputation in certain circles. Amid this success, his techniques have inspired many others. While studying well-known strategies can be helpful, they should form the building blocks of your own unique setup.

Similarly, I have established my third strategy which is highly helpful for scalpers and day traders. The **INTERSECTION** strategy is a simple strategy for beginners especially.

Let me show you how it works;

MTL/BTC

More trading books in: https://t.me/tradingpdfgratis

For starters, set your chart time frame to 60 minutes. Now make sure these two indicators are applied to your chart:

1- Exponential Moving Average (EMA) with the periods of 50 (green) 2- Exponential Moving Average (EMA) with the periods of 100 (red)

LONG TRADE: If EMA with 50 periods intersects the EMA with 100 periods from downside, it is bullish sign for scalpers and day traders. Scalpers and day traders can enter into the trade immediately after intersection for 5 – 10 % quick profit.

You can see the chart above, EMA 50 periods intersected EMA 100 periods from downside and took the pair high in due course.

SHORT TRADE: To determine when to make a short order, use the same strategy indicators in reverse.

1- Exponential Moving Average (EMA) with the periods of 50 (green)

More trading books in: https://t.me/tradingpdfgratis

2- Exponential Moving Average (EMA) with the periods of 100 (red)

If EMA with 50 periods intersects the EMA with 100 periods from upper side or above, it is bearish sign for scalpers and day traders. Scalpers and day traders can enter into the short trade immediately after intersection for 5 – 10 % quick profit.

Let me show you another example;

QTUM/BTC

Did you see?

This is QTUM/BTC chart, and the pair follows the same pattern that the previous pair. The **INTERSECTION** strategy can also be used by swing traders in larger time frames.

SWING TRADERS

STRATEGY 1

The PINBAR Strategy:

As I consider myself a swing trader, this strategy is one of my favorite i.e. **THE PINBAR.** Candles are basically show the price action or price movement of coin/asset. When candle makes a pin bar, it shows that a massive crowd of buyer or seller is there to jump in the trade which makes the candle close with rejected pin bar.

Are you thinking about pin bar? What is that?
Okay, don't worry! Let me show you.

CLAM/BTC

Did you see? Yes, this is a Pin bar.

In CLAM/BTC chart the rejected pin bar shows that the massive crowd of bear/seller is there on high level which pushed the price down and made rejected pin bar.

More trading books in: https://t.me/tradingpdfgratis

The **PINBAR** strategy suggests that if candle makes a pin bar on its swing at support level (which me be trend line or moving average support), indicates the price of pair/coin/asset is going to continue its trend.

Let me show you how it works in Long/buying as well as in short/selling trade;

LONG TRADE: If you want to enter in LONG trade or you want to BUY the pair/coin/asset using The **PINBAR** strategy, make sure the following conditions have met.

- Candle must close with pin bar.
- Pin bar must be made on support level.

Let me show you with example;

BTC/USD

Did you see in the chart that?

BTC/USD fulfilled the requirement to go LONG i.e. Candle closed with pin bar and candle makes the pin bar on median line of pitchfork support.

More trading books in: https://t.me/tradingpdfgratis

Once the condition fulfills, pair/coin/asset continued its trend and went high.

Short Trade: Similarly, the strategy works for bears or sellers. To go short in the trade, use the same strategy in reverse i.e.

- Candle must be closed with pin bar.
- Pin bar must be at strong resistance level.

STRATEGY 2

The TREND FOLLOWING Strategy:

Have you ever heard that “TREND IS YOUR FRIEND”?
Yes, this is absolutely right especially when it comes to trading crypto or any other financial market.

Price action traders can’t do without their trend lines. Trend lines are practical tools for tracking and trading trends. It makes sense to form trading strategies with this simple but useful tool.

Many traders who seem to trade with a blank chart have in fact internalized the art of trend line drawing. They can visualize the trend lines without actually drawing them.

Trend lines track trends. And when it comes to trading trends, you can go for retracements or reversals. You can work on the premise that the trend will continue or reverse.

There are two main type of trading strategies can be build up with trend lines;

1. Trend Line Bounce – Aggressive Retracement
2. Minor Trend Line Break – Conservative Retracement

2.1. TREND LINE BOUNCE (AGGRESSIVE RETRACEMENT)

A trend line bounce is a classic pullback trade. The price action premise here is that the trend (as highlighted by the trend line) will resume. A bull market will bounce up from a trend line. Likewise, a bear market will find resistance and bounce down from a bearish trend line.

More trading books in: https://t.me/tradingpdfgratis

There are two approaches for this trading strategy.

The more conservative method is to wait for a confirming price pattern to form. An example is shown below.

The more aggressive method is to enter with a limit order once price hits the trend line. It allows you to enter at a better price if the trend does resume.
However, as it lacks confirmation, its probability of success is generally lower.

If you use a limit order to enter, consider using a volatility stop-loss.

2.2. MINOR TREND LINE BREAK (CONSERVATIVE RETRACEMENT)

In this context, you are looking for a minor trend line that goes against the trend.

The beauty of this trading strategy is that it uses a single trend line for two purposes. The same trend line defines the retracement and triggers the trade.

More trading books in: https://t.me/tradingpdfgratis

As shown in the example above, this trading strategy leads us into the market on the side of the major trend. The trigger is the break of the minor trend line.

Let's drill into the specifics of the trigger. There are several definitions of a trend line break. To use it as an effective trigger, you must know which one you want to use.

You can consider a trend line broken when:

- The market trades through it.
- The market trades through it by a certain price threshold.
- A price bar closes beyond it.

REASONS WHY I AM SWING TRADER AND YOU SHOULD BECOME SWING TRADER TOO:

Let's discuss some benefits of it.

When you trade the daily chart time frame as a swing trader does, you are reaping many benefits compared to those poor souls who still believe scalping a 60minute chart is the key to success.

More trading books in: https://t.me/tradingpdfgratis

One of the reasons why swing trading is such a huge advantage to the retail trader is that it allows you to skip all the market ‘noise’ of short time frames, like those under the 1-hour chart. Brokers and the big institutional traders WANT smaller retail traders to trade short time frames and day-trade / scalp, because they know they will get your money easily if you do.

Swing trading on higher time frames like the 4 hour and daily allows you to piggy back off the big moves created by the bigger players in the market, and it also allows you to place your stop loss outside of their reach, thus giving you greater ‘staying power’ so that you can stay in the market longer and increase your chances of getting aboard a big, profitable move.

Swing trading allows you to fit trading in around whatever busy schedule you may have, or if you don’t have a busy schedule it will allow you to make money trading and still enjoy your free time. There’s nothing more boring than having to sit in front of the charts all day, not to mention that it’s bad for your trading and your health.

Swing trading allows you to analyze the markets on your schedule, for short periods of time, because you are focusing on higher time frames as mentioned above. Also, because you are holding your trades for a day or more in most cases, you can enter a trade on a Tuesday let’s say, then go to sleep and wake up a day later and check on your trade. You do not need to sit there all night worrying about your trades, nor should you. An almost ‘magical’ thing happens when you stop paying so much attention to your trades; you start to see better trading results.

People over-complicate their trading by simply being too involved. Swing trading is the best method because it’s complementary to how you should behave in the market because it rewards you for being less involved and taking less trades over time, which is exactly what you need to do if you want to have any chance at success. The take home message here is, swing trading will help you avoid overtrading, and over-trading is the biggest reason why people lose their money trading.

POSITION TRADER

STRATGEY

What is Positional Trading and how to do it?

A position trader is a type of stock/forex/commodity or crypto trader who holds a position for the long term (from months to years). Long-term traders are not concerned with short-term fluctuations because they believe that their long-term investment horizons will smooth these out.

Many position traders take a look at weekly or monthly charts to get a sense of where the asset is in a given trend.

Position trading is the polar opposite of day trading because the goal is to profit from the move in the primary trend rather than the short-term fluctuations that occur day to day.
The Position trader uses the combination of all technical, fundamental and sentimental analysis.

If you want to be position trader or you want to invest in any coin for long term, use the blend of all type of analysis.
TECHNICAL: In technical analysis, use weekly or monthly chart to know the trend of coin. Apply all other technical tools in the chart that we have already discussed in scalping/day trading strategies. If all the technical analysis predicts the upward movement, mark it and move to fundamental analysis.

Fundamental: In fundamental analysis, first of all check the total supply of coin. It will help you in calculation of ROI. Once you are satisfied with the supply move to the project and check its worth and long term usability. Then search about the team (dev), if you find the team is credible and promising, mark it and move to sentimental analysis.

More trading books in: https://t.me/tradingpdfgratis

Sentimental: This is the last confirmation you would need to enter in long term investment. Check Social media and also the electronic media to know the sentiment of investors/traders toward a specific coin/asset.
If all above mentioned analysis satisfies you, JUST GO FOR SHOT..!
