PART B PART ONE

COMPREHENSION 10 MARKS

(Paragraph 1), People with slightly shooter than usual thighs have an increased risk of diabetes, perhaps because of inadequate nutrition in early childhood or in the womb, a study found.

(Paragraph 2), Research adds to the evidence that growth and development early in life influence the risk of a variety of diseases later on.

(Paragraph 3), Early student have found that short people are more prone to heart attacks. Research zeroed in on the length of the upper leg and found an association both with risks of diabetes and to precursor, called insulin resistance.

(Paragraph 4), " I'm not saying thigh length determines diabetes ",said Dr Keilo asao. Perhaps some factors that affects thigh length also affects diabetes risk. It may be a marker of early life nutrition

(Paragraph 5), Asao,a researcher at johns Hopkins university ,presented the data at a meeting in Miami beach of American heart association .The study was based on a national health survey of 8,738 US men and women.

(Paragraph 6), Insulin resistance, also called impaired glucose tolerance, often precedes full-fledged diabetes. It occurs when the body cannot use insulin efficiently to turn sugar into energy

(Paragraph 7), Research found that the average thigh length of men and women with normal glucose tolerant was 15.8 inches. It was 15-4 inches for those with insulin resistance and 15.1 in those with diabetes

(Paragraph 8), Asao noted that leg length is determined by both genes and nutrition while the thigh continues to grow until about age 20, how long it will get is determined by about age 4

Now answer the questions that follows,

1. (Paragraph 1), People with slightly shorter than usual thighs have
A. inadequate nutrition
B. early childhood problems
C.an increased risk of diabetes
D. a disease called diabetes

2.(Paragraph 3), When researchers zeroed in on the length of the upper leg,they found……..
A. they one leg was shorter than the other
B. insulin resistance in the upper part of the leg
C. diabetes had already spread to the rest of the body
D.an association both with the risk of diabetes and insulin resistance

3.(Paragraph 4),"It may be a marker of early life nutrition''.It refer to ……
A. diabetes
B. DR kailo asao
C. some factors
D. thigh length

4.(Paragraph 7), The average thigh length of men and women with diabetes is……
A. 15.0 inches
B.15.1 inches
C.15.4 inches
D.15.8 inches

5.(Paragraph 8), At which age is one able to tell how long the thigh will grow.
A.4

B.5
C.16
D.20

6.(Paragraph 8), The length of the thigh
A. continues until about age 20
B. continues until death
C.is determined by about age 4
