Hack Instagram Account

Are you excited to learn **how to hack Instagram**? Are you trying to hack Instagram account? If yes, then you are in the right place. I will try to cover all the topics in this article. So, don't skip anything. Do everything step by step.

What is Instagram?

Instagram is a social media platform on Facebook. It was created by **Kevin Systrom and Mike Krieger** and launched in October 2010.

It was first developed for iOS devices then after a year, it was available for Android users also. This allows users to upload their photos, stories with different filters.

Users can browse trending content by tags. They also have message features to chat with different peoples within the world.

Instagram gains popularity very rapidly with **1 million users in 2 months** and 10 million in a year and 800 million users as of September 2017.

How to Hack Instagram?

Finally, I will tell you two methods by which you can hack an Instagram account. The methods by which you can hack Instagram are listed below:

1. **Brute-Force Attack**

1. **Phishing Attack**
2. **Keylogger**

In this post, I will tell you about the Brute-Force Attack. We will first generate a user-based password list by using **social engineering**. If you don't know how to generate a custom password list then [read this post first](#).

After generating a password list we will start a **Brute force attack** in which the tool will check each and every password by manually applying and the correct password will show to you.

How to do Brute Force to hack Instagram?

For Brute-Forcing we are going to use a tool named instashell you can download it by [clicking here](#).

This is a very good tool to hack Instagram. This tool has the ability to check infinite passwords via anonymous tor connection. We can also save/resume the session. It has a default password list of +39k words.

Let's Start

First of all, Install instashell by typing

```
git clone https://github.com/thelinuxchoice/instashell.git
```

Now Before jumping to the attack make sure to start your tor service by typing

```
service tor start
```

Open instashell and change the permission to the executable file of instashell.sh and install.sh by typing

```
cd instashell/  
chmod 775 instashell.sh  
chmod 775 install.sh
```

Now, Everything is done, you just need to run this module

```
./instashell.sh
```

Enter the **username** of the account of which you want to hack Instagram and then enter the name of the password list which you want to use. I am using the default password list here. You can also use your own password list by using cupp and copy that password file into instashell folder.

```
blogshacking  
password.lst
```

Now, press Enter and Enter to start the attack. It will check each and every password combination with your username and show you the correct password.

As you can see it founds the password that is **starwars**.

Always take the permission of the account owner to hack Instagram account. If you do this without the owner's permission then you can be entrapped into serious trouble and Hacking Blogs will not responsible for any kind of trouble.

This post is for education purpose only. Our main motive to write this post is to tell you about how insecure is your weak password.

Ways to Stay Safe From this Attack:

1. **Don't use an easy password with limited words.**
2. **Try not to use Dictionary word in your password.**

3. **Do not include your name, D.O.B in your password.**

Noel

February 1, 2020 at 10:48 AM

Hi! So after entering the username and “passwords.lst”. The question is does it really take a long time for the password to show up? I am just curious.. I might be waiting for nothing

Reply

Noel

February 1, 2020 at 10:52 AM

A follow up question. To use instashell on Kali Linux terminal, do I need to be connected to the internet for it to work? Thank you

Reply

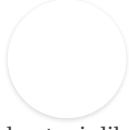

Noel

February 1, 2020 at 10:59 AM

I am seeing “tor no process found” “tor (3521): Operation not permitted”. Is it normal for it to show up while I am waiting for the password to show up? I dont know if I did something wrong while setting up Instashell for it to show up like this. Please help.

Reply

Gaurav Chandel

May 17, 2019 at 11:04 PM

If we use the same location to try different usernames and passwords combos then, Instagram will definitely get to know that we are trying to hack/access this account. That's why we are using TOR for placing proxies and security. By using proxies, it will try combos with different locations.
