Pheromones in Pest Management

Sex pheromones

- Sex pheromones are single or complex blend of different chemicals released by one insect to attract the opposite sex of the same species.
- In general, females (especially the moths) emit sex attractants to attract males for mating.
- Sex pheromones generally originate from females and attract males for mating.
- In certain species of insects, the males are known to produce the sex pheromone which attracts the females.
- Sex pheromones consist in individual molecules or specific blend of compounds in a given ratio.
- The most studied, and used in IPM, sex pheromones are that emitted by Lepidoptera.
- Sex pheromones are artificially synthesized in the laboratories and supplied as sex pheromone lures.
- Such pheromones are placed in the field to attract trap and kill the males; thus, matting is not allowed.
- Hence, sex pheromone traps can be considered as a key component in Integrated Pest Management (IPM). **(IBPS AFO 2019-20)**
