1. Definition of a function
 A function f from a set A to a set B is a rule that assigns to each element x in A exactly one element y in B . We write $f: A \rightarrow B$.
 The set A is called the domain of f , and the set B is called the codomain of f .
 The image of x under f is denoted by $f(x)$.
 The range of f is the set of all elements y in B such that $y = f(x)$ for some x in A .
 A function f is called injective (or one-to-one) if $f(x) = f(y)$ implies $x = y$.
 A function f is called surjective (or onto) if for every y in B , there exists an x in A such that $f(x) = y$.
 A function f is called bijective if it is both injective and surjective.
