

CHAPTER FOUR

MEMORY AND FORGETTING

4.1 Memory

o **Questions**

- What is memory?
- Are there different kinds of memory?
- What are the biological bases of memory?

4.1.1 Meaning and Processes of Memory

- o Memory is the retention of information/what is learned earlier over time.
- o It is the way in which we record the past for later use in the present.
- o Memory is a blanket label for a large number of processes that form the bridges between our past and our present.

Cont....

Processes of Memory

Cont.....

- o Memory processes are the mental activities we perform to put information into memory, to keep it there, and to make use of it later.
- o **a) Encoding:** Taken from computer science, the term encoding refers to the form (i.e. the code) in which an item of information is to be placed in memory.
- o In encoding we transform a sensory input into a form or a memory code that can be further processed

Cont....

- o **b) Storage:** To be remembered the encoded experience must leave some record in the nervous system (the memory trace); it must be squirreled away and held in some more or less enduring form for later use.
- o Storage is the persistence of information in memory.
- o **c) Retrieval:** is the point at which one tries to remember to dredge up a particular memory trace from among all the others we have stored.
- o In retrieval, material in memory storage is located, brought into awareness and used.

Cont....

- o Failure to remember can result from problems during any of the three phases of the memory process
- o Memory is the process by which information is encoded (phase1), stored (phase 2) and later retrieved (phase 3).

5.1.2 Stages/Structure of Memory

- o Memory structure is the nature of memory storage itself- how **information is represented** in memory and **how long it lasts** and **how it is organized**.
- o Many cognitive psychologists relate the mind to an information processor, along the lines of a digital computer that takes items of information in; processes them in steps or stages, and then produces an output.

Cont.....

- o Example;

- Consider how the computer works (see page 59 & 60 in the module)

- o According to Richard Atkinson and Richard Shiffrin (1968), memory has three structures:

I. Sensory Memory/Sensory Register: It is the entry way to memory. It is the first information storage area.

- Sensory memory acts as a holding bin, retaining information until we can select items for attention from the stream of stimuli bombarding our senses.

Cont....

- It can hold virtually all the information reaching our senses for **a brief time**.
- For instance, **visual images** (Iconic memory) remain in the visual system for a maximum of **one second**.
- **Auditory images** (Echoic memory) remain in the auditory system for a slightly longer time, by most estimates up to **two second or so**.
- Most information briefly held in the sensory memory simply **decays** from the register.

Cont....

II. Short-term Memory: is part of our memory that holds the contents of our attention.

- consist of the by-products or end results of perceptual analysis.
- STM is important in a variety of tasks such as **thinking, reading, speaking, and problem solving.**
- There are various terms used to refer to this stage of memory, including **working memory, immediate memory, active memory, and primary memory.**

Cont....

Questions

- Why do we call STM as a working memory?

Cont....

- Short term memory is distinguished by four characteristics:
 - ✓ It is active
 - ✓ Rapid accessibility
 - ✓ Preserves the temporal sequence of information
 - ✓ Limited capacity

Cont....

- According to most models of memory, we overcome this problem, by grouping small groups of information into larger units or **chunks**.
- Chunking is the grouping or “packing” of information into higher order units that can be remembered as single units.
- It expands working memory by making large amounts of information more manageable.
- The real capacity of STM is not a few bits of information but a few chunks.
- A chunk may be a word, a phrase, a sentence, or even a visual image, and it depends on previous experience.

Cont....

III. Long Term Memory

- It is a memory system used for the relatively **permanent storage** of meaningful information.
- The capacity of LTM seems to have **no practical limits**.
- LTM stores information for **indefinite periods**
- It may last for days, months, years, or even a lifetime.

Cont....

➤ The LTM is assumed to be composed of different sub systems:

❖ **Declarative/ explicit memory** the conscious recollection of information such as specific facts or events that can be verbally communicated.

✓ subdivided into semantic and episodic memories.

i. **Semantic memory**- factual knowledge like the meaning of words, concepts and our ability to do math. Keeping information on the basis of meaning of the item.

ii. **Episodic memory**-memories for events and situations from personal experience. They are internal representations of personally experienced events.

Cont....

- ❖ **Non-declarative/ implicit memory**-refers to a variety of phenomena of memory in which behaviour is affected by prior experience without that experience being consciously recollected.
 - ✓ One of the most important kinds of implicit memory is procedural memory.
- ❖ **Serial Position-** Effect occurs when you are introduced to a lot of people at a party and find you can recall the names of the first few people you met and the last, but almost no one in between.

Cont. ...

- o Factors that Influence Memory Process in Humans are as follows:
 - a. **Ability to retain:** This depends upon good memory traces left in the brain by past experiences.
 - b. **Good health:** A person with good health can retain the learnt material better than a person with poor health.
 - c. **Age of the learner:** Youngsters can remember better than the aged.
 - d. **Maturity:** Very young children cannot retain and remember complex material.
 - e. **Will to remember:** Willingness to remember helps for better retention.

Cont....

- f. Intelligence:** More intelligent person will have better memory than a dull person,
- g. Interest:** If a person has more interest, he will learn and retain better.
- h. Over learning:** Experiments have proved that over learning will lead to better memory.
- i. Speed of learning:** Quicker learning leads to better retention,
- j. Meaningfulness of the material:** Meaningful materials remain in our memory for longer period than for nonsense material,
- k. Sleep or rest:** Sleep or rest immediately after learning strengthens connections in the brain and helps for clear memory.

5.2 Forgetting

Questions

- ✓ What is forgetting? How forgetting occur or what causes forgetting?
- ✓ Why do human beings forget information?
- ✓ In what way and how do we forgot that information?
- ✓ Is forgetting bad or good for us?

4.2.1 Meaning and Concepts of Forgetting

- o Hermann Ebbinghaus (1885/1913).
- o If we attempt to encode, store and recall all the information we face daily, we are in trouble. Hence, we are selective in storing and forgetting information.
- o Psychologists generally use the term forgetting to refer to the apparent loss of information already encoded and stored in the long-term memory.

Theories of Forgetting

o 4.2.2.1. The Decay Theory

- The decay theory holds that memory traces or engram fade with time if they are not accessed now and then.
- This explanation assumes that when new material is learned a memory trace or engram- an actual physical change in the brain- occurs.
- In decay, the trace simply fades away with nothing left behind, because of the passage of

4.2.2.2. Interference

- o Interference theory holds that forgetting occurs because similar items of information interfere with one another in either storage or retrieval.
- o There are two kinds of interference that influence forgetting: **proactive and retroactive**.
- o **Proactive Interference**- information learned earlier interferes with recall of newer material.
- o **Retroactive Interference**-new information interferes with the ability to remember old information

4.2.2.3. New Memory for Old/ Displacement Theory

- o This theory holds that new information entering memory can wipe out old information, just as recording on an audio or videotape will obliterate/wipe out the original material.
- o This theory is mostly associated with the STM

4.2.2.4. Motivated Forgetting

- Sigmund Freud maintained that people forget because they block from consciousness those memories that are too threatening or painful to live with, and he called this **self-protective process Repression.**
- Today many psychologists prefer to use a more general term, motivated forgetting.

4.2.2.5. Cue Dependent Forgetting

- o Often when we need to remember, we rely on **retrieval cues**.
- o When we lack retrieval cues, we may feel as if we have lost the call number for an entry in the mind's library.
- o In long-term memory, this type of memory failure may be the most common type of all.
- o Cues that were present when you learned a new fact or had an experience are apt to be especially useful later as retrieval aids.

4.3. Improving Memory

- o To improve our memories other than drug must rely on the following mental strategies
- o **General guidelines.**
 - **Pay Attention**
 - **Encode information in more than one way**
 - **Add meaning**
 - **Take your time**
 - **Over learn**
 - **Monitor your learning**
